

Cover Letter — FlairsTech (Senior Fullstack .Net)

Headline — *LinkedIn note to the hiring team / email opener:*

ASP.NET Core, MVC and Web API over SQL Server, with a distributed backend built on RabbitMQ and Saga orchestration — plus direct experience directing an Angular migration at the architecture level.

Dear Hiring Team,

I'm applying for the Fullstack .NET role. The backend side of this posting is close to what I do day to day: as an R&D engineer at Andalusia Health Business Solution, I build enterprise applications in **C#, ASP.NET Core, MVC and Web API**, apply Clean Architecture with domain-driven boundaries over **SQL Server**, and ship an event-driven backend on **RabbitMQ** and Temporal Saga orchestration. Concretely:

- Replaced a legacy MS DTC distributed-transaction workaround with Saga orchestration and RabbitMQ messaging, improving 10+ inter-service interaction patterns.
- Built an identity/authentication server (OpenIddict, JWT, OAuth2/OIDC) and an API gateway with parallel service versioning, cutting deployment downtime from two hours to fifteen minutes.
- Modernized 5 core and 7+ additional modules off legacy .NET Framework, with unit testing and Git-based CI/CD through Azure DevOps as standard practice.

On the front end: I directed our migration from a legacy Vue 3 / AngularJS setup to a modern Angular shell architecture — setting the target architecture and overseeing delivery — but I want to be straight that this was direction and oversight rather than hands-on Angular development day to day. I have working TypeScript/JavaScript knowledge and I'm ready to be tested on it directly rather than have that surface later.

I have a personal connection inside FlairsTech, which is part of why I'm applying directly rather than only through the posting — happy to have that conversation alongside this application.

I'd welcome the chance to discuss.

Best regards, Moamen Basyoni
