

Cover Letter — Areeb Technology (Senior .NET Developer)

Headline — *LinkedIn note to the hiring team / email opener:*

The .NET engineer who already builds the AI tooling on your “nice to have” list — internal Model Context Protocol servers, multi-model LLM orchestration, automated code review — on top of resilient distributed systems (RabbitMQ, Temporal Saga) and hands-on legacy-to-modern .NET migration.

Dear Hiring Team,

I’m applying for the Senior .NET Developer role. Two things in your description line up unusually well with my work: the resilient distributed systems with asynchronous messaging, and the AI preferences — Model Context Protocol and prompt engineering. I do both today at Andalusia Health Business Solution.

On distributed systems and modernization:

- I design REST and gRPC API contracts before implementation and build fault-tolerant asynchronous messaging with RabbitMQ, plus long-running distributed transactions via Temporal Saga orchestration — improving 10+ inter-service interaction patterns.
- I integrate legacy systems with modern platforms: I’ve migrated modules from .NET Framework 4.5 / ASP.NET Core 2.2 toward modern .NET with Clean Architecture across 5 core and 7+ additional modules, and built a runtime business-rule engine that improved rule-execution performance by 45% (BenchmarkDotNet).
- Security: an OpenID Connect / OAuth2 identity server (OpenIddict) with JWT access and refresh tokens, scope- and claim-based authorization, and OWASP-aware secure coding.
- Data access with Entity Framework Core and LINQ over SQL Server and PostgreSQL, with .NET Aspire in the same codebase.

On AI: I’ve built internal MCP servers, an automated code-review and pull-request analysis pipeline, and multi-model orchestration across OpenAI and OpenRouter with observability, guardrails, and cost controls. This is production work, not experimentation.

To be straightforward: I’m at roughly three years rather than five, and my structured-logging has been LLM-side (LangSmith, LangFuse) rather than Serilog and OpenTelemetry in .NET — I’m adding both to a sample service now. I believe the depth of the distributed-systems and modernization work speaks to the level.

I’d welcome a conversation.

Best regards, Moamen Basyoni
