

Cover Letter — Lamdax (Senior Backend .NET Core Developer)

Headline — *LinkedIn/Workable note to the hiring team or email opener:*

Your stack names OpenIddict and JWT specifically — I designed and built an identity server on exactly that stack, plus RabbitMQ event-driven communication and a Temporal Saga replacement for a legacy distributed-transaction design. Three years, not six, but the depth is real.

Dear Hiring Team,

I'm applying for the Senior Backend .NET Core Developer role. I want to be upfront about the one number that doesn't match: you're asking for 6+ years, and I have roughly three. I'm applying anyway because the technical overlap is unusually specific, and I'd rather let that speak than not try.

You name OpenIddict and JWT in your stack. I designed and built an identity/authentication server on exactly that combination — OpenIddict issuing JWT access and refresh tokens with scope- and claim-based authorization — at Andalusia, a healthcare platform serving hospitals across Egypt and Saudi Arabia. On event-driven architecture, I implemented RabbitMQ-based communication and replaced a legacy MS DTC distributed-transaction workaround with Temporal Saga orchestration, improving 10+ inter-service interaction patterns. I don't have production event-sourcing experience specifically — pub/sub, yes; an event store as source of truth, no — and I'd rather say that plainly than imply otherwise.

On the rest of the stack: C#, ASP.NET Core, Entity Framework Core over SQL Server, Consul-based service discovery, and an Nginx API gateway that cut deployment downtime by 87.5%. A runtime rule engine I optimized runs 45% faster, measured with BenchmarkDotNet — direct evidence of the high-throughput tuning work you're asking about.

I'd welcome a conversation, including about the contract structure and rate.

Best regards, Moamen Basyoni
