

Cover Letter — Crossing Hurdles (Senior C# Engineer)

Headline — *LinkedIn note to the hiring team / email opener:*

I build the thing you're hiring for: Roslyn static analysis fused with LLM interpretation, an automated PR reviewer that checks code against its stated requirements, and LLM evaluation through LangSmith/LangFuse across multiple models. Three years of production C# underneath it.

Dear Hiring Team,

I'm applying for the Senior C# Engineer role. Most applicants will bring either strong C# or LLM evaluation experience. My current job is specifically the overlap.

As an R&D engineer at Andalusia I've built:

- An **AI code-documentation system** that combines **Roslyn** static analysis and code metrics with LLM interpretation, so the output carries both a structural and a semantic view of a codebase.
- An **automated pull-request reviewer** on Azure DevOps that opens threads, posts overall and line-level comments, and checks whether an implementation actually matches the business requirements in its linked work item. That is, functionally, triaging changes and judging model output against intent.
- A **code graph across 38 modules** of a production application, mapping code to business capability — built precisely because reading a large unfamiliar codebase quickly is hard.
- **LLM evaluation and observability** with LangSmith and LangFuse — prompt telemetry, token tracking and cross-model comparison — with multi-model orchestration over OpenAI and OpenRouter.

On the C# side: I work in **C#, ASP.NET Core and .NET 8/9/10** with Entity Framework Core, and a large part of my job is extending and refactoring a mature codebase that long predates me — 5 core and 7+ modules modernized off .NET Framework 4.5, including replacing a legacy MS DTC design with Temporal Saga orchestration. Forming an accurate model of unfamiliar code fast is the skill that work is made of. **Git and Docker** are daily tools; I migrated our source control from a legacy TFVC monolith to Azure DevOps Git multi-repo.

I also use Claude Code daily, so I have a practical sense of where these models are strong, where they quietly fail, and what a fair assessment of their output looks like.

I'm comfortable with the remote contract structure, and I'd want to confirm the exact PST overlap window early so we're both clear it works.

I'd welcome a conversation.

Best regards, Moamen Basyoni
