

Cover Letter — egabi Solutions (Sr. Backend Software Developer)

Headline — *LinkedIn note to the hiring team / email opener:*

Backend developer working daily in both a large legacy .NET Framework estate and modern .NET Core — Onion architecture, CQRS, EF Core over SQL Server — with a track record of modernizing mature codebases rather than only building new ones.

Dear Hiring Team,

I'm applying for the Sr. Backend Software Developer role. Two parts of your description match my day job closely: the architecture you list as desirable, and working across both legacy .NET and .NET Core.

On architecture — I build with **Onion and layered architecture**, **CQRS**, Repository and Dependency Injection, applying SOLID throughout, on **C#**, **ASP.NET Core** and **.NET 8/9/10** with **Entity Framework Core over SQL Server**. Specifics:

- Built a runtime business-rule engine for injected business logic that improved rule-execution performance by **45%**, measured with BenchmarkDotNet.
- Designed REST and gRPC API contracts before implementation, improving 10+ inter-service interaction patterns.
- Implemented an OpenID Connect / OAuth2 identity server with JWT and scope-based authorization.
- Built the distributed layer: RabbitMQ messaging, Consul service discovery, and an API gateway with health-aware load balancing that cut deployment downtime from two hours to fifteen minutes.

On legacy — a large part of my work is inside a **mature .NET Framework 4.5 and ASP.NET Core 2.2 codebase**, extending and refactoring it while modernizing it. I've migrated 5 core and 7+ additional modules to modern .NET, and replaced a legacy MS DTC distributed-transaction design — which had forced the whole system onto one shared database — with Temporal Saga orchestration. I also moved source control off a legacy TFS/TFVC monolith to Azure DevOps Git with a private NuGet feed. I'm comfortable in old code, which in my experience is a larger part of senior backend work than job descriptions usually admit.

Two things to be straight about. I haven't worked with **WCF** — my legacy exposure is .NET Framework application and data code rather than SOAP services, though that's the same era and I'd pick it up quickly. And on **Angular**: I directed our frontend migration to it, setting the architecture and overseeing delivery, but I wasn't the hands-on Angular developer. Given this is a backend role I hope that's the right side of the line, but I'd rather say so now.

I'd welcome the chance to discuss.

Best regards, Moamen Basyoni
