

Cover Letter — Jaheziya (Backend Developer, .NET)

Headline — *LinkedIn note to the hiring team / email opener:*

A backend engineer who's replaced a legacy distributed-transaction design with Saga orchestration and built the identity, API gateway, and service-discovery layer around it — with production experience on both Azure and AWS, which covers your "Azure or AWS" line either way.

Dear Hiring Team,

I'm applying for the Backend Developer (.NET) role. Your requirements line up closely with what I actually build day to day: C#, ASP.NET Core, RESTful APIs, and SQL Server, with clean and scalable architecture as the explicit standard rather than an afterthought.

At Andalusia, I've spent the last two years modernizing a large healthcare platform's backend: replacing a legacy MS DTC distributed-transaction workaround — which had forced the entire system onto a single shared database — with Temporal Saga orchestration, and building the surrounding distributed-systems infrastructure myself: an OIDC/OAuth2 identity server, Consul-based service discovery, and an Nginx API gateway whose parallel-versioning design cut deployment downtime from two hours to fifteen minutes. In parallel, I migrated our source control from a TFVC monolith to Azure DevOps Git multi-repo, decomposing project-level coupling across the codebase.

On your preferred list: I've worked across **both** Azure (App Service, Blob Storage, managed SQL, Static Web Apps) and AWS (EC2, S3), evaluating and delivering on whichever fit the project. I use Docker daily, and I've built CI/CD pipelines on Azure DevOps and GitHub Actions from scratch more than once.

I'm comfortable relocating to Abu Dhabi for the right role, and would appreciate clarity on visa sponsorship for candidates outside the UAE as part of the process.

I'd welcome the chance to discuss how I could contribute to your team.

Best regards, Moamen Basyoni
